the 1990s, the number of people in the world who are undernourished has increased from 600 million to 800 million (FAO 1996).

There are a number of reasons why the world's population is becoming more undernourished. The first is that the world's population is growing rapidly. The second is that the world's population is becoming more urbanized. The third is that the world's population is becoming more dependent on food imports.

The first reason is that the world's population is growing rapidly. The world's population is growing at a rate of about 1.2% per year. This means that the world's population will be about 8 billion in 2025, up from about 6 billion in 1990.

The second reason is that the world's population is becoming more urbanized. The world's population is becoming more urbanized at a rate of about 1.2% per year. This means that the world's population will be about 60% urban in 2025, up from about 40% in 1990.

The third reason is that the world's population is becoming more dependent on food imports. The world's population is becoming more dependent on food imports at a rate of about 1.2% per year. This means that the world's population will be about 20% dependent on food imports in 2025, up from about 10% in 1990.

There are a number of reasons why the world's population is becoming more dependent on food imports. The first is that the world's population is growing rapidly. The second is that the world's population is becoming more urbanized. The third is that the world's population is becoming more dependent on food imports.
