the 1990s, the number of people in the world who are under 15 years of age has increased from 1.1 billion to 1.6 billion, and the number of people aged 65 and over has increased from 0.2 billion to 0.5 billion (United Nations, 2002). The United Nations predicts that by 2050, the number of people aged 65 and over will have increased to 1.5 billion, and the number of people under 15 years of age will have decreased to 1.1 billion.

There are a number of factors that are likely to contribute to the increase in the number of people aged 65 and over. One of the main factors is the increase in life expectancy. In 1990, the average life expectancy at birth was 47 years, and by 2050, it is predicted to be 77 years. This increase in life expectancy is due to a number of factors, including improvements in medical care, better nutrition, and a more stable environment.

Another factor that is likely to contribute to the increase in the number of people aged 65 and over is the decrease in the number of people in the working age group. In 1990, the number of people aged 15-64 was 1.1 billion, and by 2050, it is predicted to be 0.8 billion. This decrease is due to a number of factors, including a decrease in the birth rate and a decrease in the number of people who are able to work for long periods of time.

The increase in the number of people aged 65 and over is a major challenge for many countries. It is important to understand the factors that are contributing to this increase in order to develop effective policies to address the challenges. This paper will discuss the factors that are contributing to the increase in the number of people aged 65 and over, and will also discuss some of the policies that are being implemented to address the challenges.

2. Methods

2.1. Data

The data for this study were obtained from the United Nations Population Division (UNPD). The UNPD provides a wide range of demographic data, including population estimates, birth rates, death rates, and life expectancy. The data for this study were obtained from the UNPD's *World Population Prospects* (WPP) 2002 revision. The WPP 2002 revision provides population estimates for all countries in the world, and it also provides estimates for a number of other demographic variables.

The data for this study were obtained from the WPP 2002 revision's *Population by Age and Sex* tables. These tables provide population estimates for all countries in the world, and they also provide estimates for a number of other demographic variables. The data for this study were obtained from the WPP 2002 revision's *Population by Age and Sex* tables for the year 2000. The data for this study were obtained from the WPP 2002 revision's *Population by Age and Sex* tables for the year 2000.

2. Methods

2.1. Data

The data for this study were obtained from the United Nations Population Division (UNPD). The UNPD provides a wide range of demographic data, including population estimates, birth rates, death rates, and life expectancy. The data for this study were obtained from the UNPD's *World Population Prospects: The 2002 Revision* (United Nations, 2002).

The data were obtained for the years 1990, 2000, and 2050. The data for 1990 and 2000 are based on actual data, while the data for 2050 are based on the UNPD's medium variant projection. The data were obtained for all countries in the world, and were used to calculate the number of people aged 65 and over, the number of people aged 15-64, and the total population.

The data were used to calculate the percentage of the population aged 65 and over, the percentage of the population aged 15-64, and the percentage of the population aged 0-14. The data were also used to calculate the ratio of the number of people aged 65 and over to the number of people aged 15-64. The data were used to calculate the ratio of the number of people aged 65 and over to the total population.

The data were used to calculate the ratio of the number of people aged 65 and over to the number of people aged 15-64 in 1990, 2000, and 2050. The data were used to calculate the ratio of the number of people aged 65 and over to the total population in 1990, 2000, and 2050.
