--	--

the 1990s, the number of people in the world who are under 15 years of age has increased from 1.1 billion to 1.6 billion, and the number of people aged 65 and over has increased from 0.2 billion to 0.5 billion (United Nations, 2002). The United Nations predicts that by 2050, the number of people aged 65 and over will have increased to 1.2 billion, and the number of people under 15 years of age will have decreased to 1.1 billion (United Nations, 2002).

There are a number of factors that are likely to contribute to the increase in the number of people aged 65 and over. One of the main factors is the increase in life expectancy. In 1990, the life expectancy at birth was 47 years for men and 51 years for women. By 2050, the life expectancy at birth is predicted to be 74 years for men and 79 years for women (United Nations, 2002). This increase in life expectancy is due to a number of factors, including improvements in medical care, better nutrition, and a decrease in the number of people who die from infectious diseases.

Another factor that is likely to contribute to the increase in the number of people aged 65 and over is the decrease in the number of people who die from infectious diseases. In 1990, 10 million people died from infectious diseases. By 2050, the number of people who die from infectious diseases is predicted to be 1 million (United Nations, 2002). This decrease in the number of people who die from infectious diseases is due to a number of factors, including improvements in medical care, better nutrition, and a decrease in the number of people who live in poor conditions.

The increase in the number of people aged 65 and over is a major challenge for many countries. In many countries, the number of people aged 65 and over is increasing faster than the number of people aged 15 and under. This means that the number of people who are dependent on others is increasing. In many countries, the number of people who are dependent on others is increasing faster than the number of people who are able to support them. This means that the number of people who are dependent on others is increasing faster than the number of people who are able to support them.

There are a number of ways in which countries can deal with the increase in the number of people aged 65 and over. One way is to increase the number of people who are able to support them. This can be done by increasing the number of people who are able to work, by increasing the number of people who are able to retire, and by increasing the number of people who are able to receive social security benefits. Another way is to decrease the number of people who are dependent on others. This can be done by increasing the number of people who are able to live independently, by increasing the number of people who are able to receive social security benefits, and by increasing the number of people who are able to receive social security benefits.

The increase in the number of people aged 65 and over is a major challenge for many countries.
